

Sr. No	Domain	Problem Statement
1	Logistics & Transportation	Predictive Maintenance for Logistics Operations: Create an AI-powered system that tracks and predicts maintenance needs for both delivery vehicles and warehouse equipment. The system should adjust routes, schedules, and operations automatically to reduce downtime, improve efficiency, and keep the supply chain running smoothly.
2	Logistics & Transportation	Smart Inventory Restocking System : Develop an AI model that tracks warehouse inventory levels and predicts when restocking will be required, reducing excess stock.
3	Security & Cybersecurity	AI-Based Anomaly Detection for Intrusion: Develop an AI-powered anomaly detection system to identify network intrusions in home networks by analyzing traffic patterns, device behavior, and network logs. The system should learn what constitutes 'normal' network activity and flag unusual or potentially malicious behavior in real-time.
4	Security & Cybersecurity	Digital Footprint Analyzer : Develop an AI tool that can aggregate publicly available information about a person (given a name or social media handle) from various OSINT sources like social media, news articles, forums, and public records to generate a comprehensive digital footprint.
5	Workplace	Grocery Store AI Assistant : Consumers often struggle to quickly access nutritional and ingredient details while shopping. Build a CV-powered grocery assistant that scans food labels and displays nutritional info, allergens, and eco-friendliness of products.
6	Workplace	Industrial Hazard Detection : Develop a Computer Vision-based Industrial Hazard Detection System that analyzes real-time video feeds to identify unsafe object placements (e.g., unsecured metal beams, blocked pathways, liquid spills) and alerts workers to potential risks. The system should detect anomalies, assess danger levels, and provide real-time notifications to enhance workplace safety.
7	Smart Cities	Smart Traffic Violation Detection System : Develop an AI-powered
8	Healthcare	Mental Health Monitoring and Early Stress Detection System :
9	Healthcare	Prescription Error Detection : Develop a model that scans and detects handwritten prescription errors, ensuring safe medication dispensing by flagging illegible or incorrect prescriptions.
10	Healthcare	Smart Diet Planner : Build a system that suggests personalized meal plans based on dietary restrictions, allergies, and health goals using NLP and image recognition.
11	Education & EdTech	AI-Based Evaluator: Build an AI-powered exam grading system that automates evaluation for handwritten and typed responses, allows manual teacher review, and generates exportable reports for students.
12	Education & EdTech	AI Tutoring System : Create a model that analyzes student performance and suggests personalized learning materials for weak areas in subjects like math or programming.
13	Education & EdTech	Plagiarism & AI-Generated Content Detector : Design a tool that detects AI-generated vs. human-written text and flags plagiarized content in academic submissions.
14	Social Good & Ethics	Bias Detection in AI Models : Develop a tool that audits AI models for bias in gender, race, or socio-economic factors, ensuring fairness in decision-making systems.

15	Social Good & Ethics	Emergency Response AI for Natural Disasters : Create a system that analyzes social media posts, news, and weather data to detect and prioritize emergency rescue needs in disaster-stricken areas.
16	Social Good & Ethics	AI-Based Suicide Prevention System : Design a model that analyzes social media posts and messages for signs of distress and suggests early intervention strategies.
17	Social Good & Ethics	Missing Person Finder : Build an AI system that scans social media, news reports, and public databases to track missing persons based on facial recognition, geotagged data, and activity patterns.
18	Social Good & Ethics	AI-Powered Accessibility Assistant for Visually Impaired Users : Create a tool that describes images, text, and surroundings using NLP and speech synthesis, helping visually impaired individuals navigate digital and physical spaces.
19	Social Good & Ethics	Urban Wildlife Coexistence System : Develop an AI system that monitors and analyzes interactions between urban wildlife (e.g., stray animals, birds, and even invasive species) and human environments using CCTV footage. The system should detect potential conflicts, such as animal-vehicle collisions, stray animals attacking humans, overpopulation in certain areas.
20	Open Innovation	Participants are free to choose a problem statement of their liking as long as it is incorporating AI technologies and has a scalable social impact.
